                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              he invention relates to novel isolated lipid metabolism proteins (IMP) nd encoding nucleic acids comprising a polynucleotide sequence encoding polypeptide that functions as a modulator of seed storage compounds in plant. The LMP nucleic acid is useful in producing transgenic plants ith increased levels of seed storage compound, e.g. lipid, a fatty acid, starch or a seed storage protein, as markers for specific regions of he genome and for evolutionary and protein structural studies. The resent sequence represents an LMP of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2004-157121/15.

Specifically, it refers to identifying genes that are up or down-regulated in transgenic plants overexpressing the heterodimeric E2Fa/DPa transcription factor of Arabidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Altering plant characteristics, useful for producing plants for enzyme opharmaceutical production comprises modifying in a plant, expression of one or more nucleic acids and/or modifying level or activity of one or

The present invention describes isolated polynucleotides (PN) comprising a sequence selected from one of 835 nucleotide sequences given in AAA67073 to AAA67907, their (reverse) complements, sequences producing an Expectation (E) value of 0.01 or less compared to the 835 sequences, sequences at least 50% identical to them, 200, 100, 40 or 20-mers of the 835 sequences that are degenerately equivalent or allelic to the 835 sequences. The polynucleotides are used to modify the activity of a polypeptide involved in a polypeaccharide biosynthetic pathway in the plant. They are especially used to modulate or alter the polysaccharide content, composition or structure of the plant. AAB16268 to AAB16340 are
                                                                                                                                                                                     New genes encoding proteins involved in a plant polysaccharide biosynthetic pathway, useful for modulating or altering the polysaccharide content, composition or structure of the plant.
                                                                                                                                                                                                                                                  WPI; 2000-339328/29

The polynucleotides are used to modify the activity of a polypeptide involved in a polysaccharide biosynthetic pathway in the plant. They are especially used to modulate or alter the polysaccharide content, composition or structure of the plant. AAB16268 to AAB16340 are proteins encoded by some of the polynucleotide sequence given in the

The coding sequences and proteins of the present invention are useful for modulating a PCD or cell death pathway and various developmental pathways in a forestry plant, by stably incorporating one of the present coding sequences into the genome of the forestry plant, where the coding sequence provides a PCD pathway that is not present in a native form of the forestry plant

The methods and compositions of the present invention to do with (I) are useful for modulating programmed cell death and thereby altering the development cycle of plant cells, and altering plant development. This is the amino acid sequence of a protein associated with the programmed cell death pathway.

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes an isolated polynucleotide (I) comprising a nucleotide sequence that is one of 145 fully defined sequences of 221-3415 base pairs (bp), given in the specification, and/or its complements, reverse sequences, or sequences having 75, 90 or 95 $ sequence identity to or that hybridise under stringent hybridisation conditions to one of the 145 sequences. The methods and compositions of the present invention to do with (I) sequences full for modulating programmed cell death and thereby altering the development cycle of plant cells, and altering plant development. This is the amino acid sequence of a protein associated with the programmed cell death pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide useful for modulating programmed cell death, altering the development cycle of plant cells, and subsequently modifying plant development.
                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 316
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 12; Fig 27; 214pp;

fiber annexin - upland cotton
C;Species: Gossypium hirsutum (upland cotton)
C;Acces: 29-Oct-1999 #sequence_revision 29-Oct-1999 #text_change 09-Jul-2004
C;Accession: T31428
R;Shin, H.; Brown, R.M.
submitted to the EMBL Data Library, February 1997
A;Reference number: Z21028
A;Accession: T31428
A;Ccession: T31428
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: mRNA
A;Residues: 1-316 <SHI>
A;Cross-references: UNIPROT:OB2090; EMBL:U89609; NID:g3493171; PID:g3493172
A;Experimental source: strain Texas Marker1
C;Superfamily: annexin I; annexin repeat homology
C;Keywords: calcium binding
                                    annexin upland cotton (fragment)

annexin-like protein - Arabidopsis thaliana
N;Alternate names: protein T31P16,220
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 02-Jun-2000 #sequence_revision 02-Jun-2000 #text_change 09-Jul-2004
C;Accession: T50027
R;Bevan, M; Zimmermann, W; Grueneisen, A; Wambutt, R; Kalicki, J; Wohld submitted to the Protein Sequence Database, May 2000
A;Reference number: Z25027
A;Accession: T50027
A;Accession: T50027

annexin P33 - maize
C;Species: Zea mays (maize)
C;Date: 24-Mar-1999 #sequence_revision 24-Mar-1999 #text_change 0
C;Accession: T02961
R;Battey, N.H.; James, N.C.; Greenland, A.J.
Plant Physiol. 112, 1391-1396, 1996
A;Title: CDNA isolation and gene expression of maize annexins P33
A;Reference number: Z14796; MUID:97092863; PMID:8938425
A;Accession: T02961
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: mRNA
A;Residues: 1-314 <BATy
A;Coss-references: UNIPROT:Q43863; EMBL:X98244; PIDN:CAA66900.1
A;Experimental source: cultivar clipper; root tip
C;Superfamily: annexin repeat homology
F;14-85/Domain: annexin repeat homology <AXR>

Sequence 6593, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION: Craig et al.

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION A FILE REFERENCE: CL001307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/237,768

PRIOR FILING DATE: 2000-10-20

PRIOR FILING DATE: 2000-09-08

PRIOR FILING DATE: 2000-09-08

PRIOR FILING DATE: 2000-09-08

PRIOR FILING DATE: 2000-09-08

PRIOR FILING DATE: 2000-09-08

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
